

FINAL UI REFERENCE · VERSION 4

Nipuna CRM

Developer handoff

Implement today's UI changes in the existing CRM application. This document captures the published demo version and its expected behaviour.

Public UI reference

<https://nipuna-crm-workspace.nipunatech.chatgpt.site>

SAMPLE DATA — NO LIVE INTEGRATIONS

Where the changes exist: ChatGPT Site version 4 only. They are not automatically present in the developer's live application or the frozen GitHub branch. Keep **feature/crm-frozen-ui-v1** in **nipunatechnologies-admin/nipuna-crm** unchanged. Implement in the developer's normal working branch.

Today's changes to implement

Area	Final UI / expected change
Workspace	Modern dashboard, navigation, lead register, pipeline, student cards and finance screens. Preserve existing CRM workflows and Guntur/Vijayawada separation.
Lead detail	Phone number beside Call, WhatsApp, Email and Convert to deal. WhatsApp uses green. Conversion is enabled after the qualification review is complete.
Pipeline	Seven clickable stage counts above the board/list. Add branch-specific Next actions below, with Review deal links.
Deals + finance	Create invoice directly from a deal; show View invoice once created. Use one linked invoice/payment/receipt record across finance views.
Documents	Responsive Guntur and Vijayawada invoice templates, correct issuing address, course lines, instalments, verified receipts and balance. Print / Save PDF entry point.

Lead colour specification

Label	Background	Text	Status dot
Hot / New / New Enquiry	#E8F8EE	#167341	#1A9B52
Warm	#FFF2D6	#925600	#D89314
Cold	#EAF2FF	#2459A6	#3476CC
Future joining / Waiting for Batch	#F0EAF4	#7445A4	#9562C7

Use matching dots and visible text labels on desktop, mobile and detail views. New is an intake status; it shares the requested green treatment. WhatsApp: background **#25D366**, text **#083E20**. Main workspace accent: **#6251DA**; UI font: Open Sans.

01 / SCREEN BEHAVIOUR

Lead to admission

The developer should reproduce both the screen arrangement and the button behaviour.

Lead detail and conversion

Top action row: phone number, Call, WhatsApp, Email, Convert to deal. Keep the number visible alongside the actions and allow the row to wrap on mobile. Contact actions in this Site are simulated.

Convert to deal: require a completed qualification review; open the conversion form for courses, branch, owner and expected close date. Conversion creates the opportunity before payment. It does not create an admission, receipt or LMS account.

Pipeline stage counts

Stage count	Display / behaviour
Counselling	Count and filter counselling deals.
Demo scheduled / Demo attended	Separate count chips. The board can group both under Demo.
Fee discussion	Fee discussion / payment awaited opportunities.
Payment review	Payment pending verification; not yet a verified receipt.
Admitted / Closed lost	Separate count chips for admitted and lost deals.

These are **seven** stage counts. Counts use the selected branch; clicking a stage filters the board/list. Clear the stage filter to restore all opportunities. New Enquiry stays in Leads and is outside these deal counts.

Next actions at the bottom: pending payment evidence, demo outcome, missing accepted delivery plan, invoice preparation, then balance/payment follow-up. Each action opens its related deal and respects the selected branch.

Lifecycle and record creation

Step	Record effect / rule
1. Qualify and convert	Create deal(s) for selected course opportunities; preserve the same person identity.
2. Accept delivery plan	Confirm the course delivery plan before invoicing.
3. Create invoice	Bill one course or compatible course deals together. No admission is created merely by invoicing.
4. Record payment	Create a pending payment claim linked to the invoice. Do not reduce the verified balance yet.
5. Verify payment	Create receipt; update net paid and balance. Create eligible course admissions and the student if needed, reusing one student/person for multiple courses.
6. Grant LMS access	Separate eligibility/policy step after admission. The prototype has no live LMS integration.

One person, multiple courses: use course-level deals/admissions linked to the same student. A later course enrolment must reuse that identity. A single invoice may receive one payment or several receipts.

02 / BRANCH INVOICES AND FINANCE

One invoice, linked records

The collecting/issuing branch on the deal determines the invoice identity and address.

GUNTUR · NIT-GNT

Door No. 6-4-35, 1st Floor,
4/1 Arundelpet
Opposite Aditya Grand Hotel
Guntur, Andhra Pradesh 522002, India

vijayawada@nipunacareers.com

Invoice creation rules

Deal action: Create invoice opens a form with issuer/address preview, learner, courses, charges and payment plan. After creation, open the invoice and show View invoice on the contributing deal(s).

Combine courses only when: the deals belong to the same person and collecting branch, are active and uninvoiced, and have accepted delivery plans. Block duplicate invoicing, closed-lost deals and missing accepted plans.

Branch snapshot: copy the issuer details from the deal's branch when issuing. A viewer changing the workspace branch filter must never change an issued invoice's issuer, address or branch identity.

Template and payment behaviour

Item	Expected result
Invoice layout	Branch identity/address/contact, learner, invoice reference/date, course and deal lines, total, verified net paid, balance, instalments and verified receipts. Guntur accent: purple; Vijayawada: teal.
Record payment	Open Payments with the correct invoice already selected. Pending/failed payment does not reduce the balance and must not look like a verified receipt.
Verify payment	Create a linked receipt and update Deals, Invoices, Payments, Receipts, Collections and relevant reports consistently. Repeat payments add receipts against the same invoice.
Plans in current demo	Full payment; 50/50 with exact second due date chosen within day 10-15; or 50/25/25 on day 0/10/15. Do not assume an unrestricted custom EMI builder is implemented.
Print / Save PDF	Keep all invoice information legible on desktop, mobile and print. Validate actual PDF output in the live implementation. Use approved tax/bank details only.

Sample acceptance case: invoice ₹22,000; payment claim ₹5,000 pending = verified paid ₹0 and balance ₹22,000. After verification = one receipt, paid ₹5,000, balance ₹17,000. Finance views must agree.

03 / IMPLEMENTATION AND REVIEW

Developer acceptance checklist

Match the published UI, then verify the implementation against approved business rules.

Check	Acceptance criterion
Visual consistency	Match page hierarchy, spacing, typography, cards, buttons and the four lead status colours across desktop and mobile.
Lead actions	Phone stays visible; WhatsApp is green; conversion requires qualification and preserves the person/course links. No admission at conversion.
Branch pipeline	Stage counts, filters and Next actions match Guntur/Vijayawada records independently. Empty stages and filter reset work.
Branch invoice	Create from both branches. Confirm correct address and issuer snapshot. Switching branch filters never rewrites an invoice.
Courses and identity	Test one course, multiple courses together and a later course for the same student. Combine only compatible deals; prevent duplicate invoices.
Payment scenarios	Test full payment, partial/token then balance, and multiple instalment payments. Pending claims do not count as collected. Each verified payment has the correct receipt and allocation.
Finance consistency	Invoice total, verified paid, remaining balance, receipt history, collection dues and reports agree after each action. Persist records and prevent repeated verification/duplicate creation.
Responsive + documents	Check desktop and 360/390 px mobile widths, action wrapping, dialogs, cards, invoice layout and actual print/PDF output.
Production behaviour	Enforce authenticated roles and branch access on the backend; test refresh/reload persistence, unique document numbers and linked records in the developer's environment.

What has already been checked in the prototype

Checked: desktop/mobile layouts, conversion, branch stage filters, Next actions, both invoice templates and payment verification. The two-course test produced two admissions for one student. TypeScript checks and the build passed.

Not verified: native invoice print / saved PDF output, persistent data, server permissions and production integrations. Validate these in the developer's environment.

Scope boundaries

Synthetic, in-memory data resets on refresh. Roles and AI suggestions are simulated. No HDFC, WhatsApp, email, telephony, database, LMS or production authentication is connected. Keep **SAMPLE DATA — NO LIVE INTEGRATIONS** visible in the demo. Exclude live CRM discount rules and production use of sample records.

Custom EMI, complementary-course and referral-course rules remain in the broader CRM/LMS specification; this handoff does not certify their full implementation.

Requested developer response

Return a review URL, completed checks, backend gaps and delivery estimate. Review the implemented version before rolling changes into the live site.
